Read the short passage below and answer the questions that follow.

Every 70 Australians are on the autism spectrum. The proportion of children with autism is higher – more than 80% of all Australians on the autism spectrum are aged under 25. Autism is most prevalent among school-aged children between 5 and 14. Many of these children have learning, communication and intellectual difficulties. The high proportion of children with autism spectrum presents an obvious challenge to teachers and the learning environment. Visual information is stimulated when exposed to visual information. People with autism sometimes perform better when given visual tasks. One way to possibly stimulate is it through the use of video-based instruction (VBI). VBI helped children with autism gain skills that showed students with autism could more easily learn functional skills and transfer them. The children are taught to actively analyse an everyday episode – a memory of a previous experience - and to build alternative stories around it, with a **protagonist**. They learn to visualise the situation and imagine it changing. Many children with autism have often difficulty with reading comprehension. Some research shows that visualisation strategies to reading underachievers generally enhances reading comprehension.
